Humboldt Redwood Company (HRC) Project Description

Title: Amphibian and Reptile Monitoring

Purpose: Habitat Conservation Plan Monitoring

Date Initiated: March 1999

Projected End Date: Ongoing

Project Manager: Sal Chinnici, Director, Forest Sciences

Executive Summary:

The HRC HCP includes four covered amphibians (southern torrent salamander, tailed frog, yellow-legged frog, and red-legged frog) and one covered reptile (western pond turtle). The HCP's strategy for conserving and monitoring the covered amphibian and reptile species is a landscape approach to protecting habitat, assessment of habitat conditions through watershed analysis, and species surveys and population monitoring.

With this summary report covering the 2021-2022 monitoring period there was an emphasis on watershed analysis revisit work for the Upper Eel Watershed Analysis Unit (WAU), and we also cover cumulative monitoring efforts in the WAU to date. For tailed frogs, site occupancy and habitat conditions were monitored at ten different sites during 2013 and 2021. For southern torrent salamanders, site occupancy and habitat conditions were monitored at 18 different sites during the years 2012-2014, and 2021. For foothill yellow-legged frogs, site occupancy and habitat conditions have been monitored at 45 sites over the years 2011 - 2013, 2017, and 2021. Surveys for northwestern pond turtles indicated that they are common in suitable habitat on the mainstem Eel River. We visited three monitoring locations to check for occupancy in 2021. No northern red-legged frog surveys were conducted in the Upper Eel WAU during the 2021-2022 reporting period. Results of monitoring efforts are discussed below.

INTRODUCTION

The purpose of this summary report is to provide the results of surveys and monitoring of the covered amphibian and reptile species of the Humboldt Redwood Company (HRC) Habitat Conservation Plan (HCP). This report covers the period of 2021 to 2022 and is focused on the Upper Eel WAU, including cumulative monitoring efforts in this WAU to date.

Surveys and habitat assessments for the covered species have been ongoing through implementation of HCP monitoring strategies. Sections of the HCP addressing amphibians and reptiles include: 6.3.2.1, 6.3.5.2.4, and 6.10. These HCP sections discuss the process by which both watershed analysis and effectiveness monitoring address the covered species' habitat needs.

Four amphibian and one reptile species are covered under the HRC HCP: the southern torrent salamander (*Rhyacotriton variegatus*, RHVA); tailed frog (*Ascaphus truei*, ASTR); northern red-legged frog (*Rana aurora aurora*, RAAU); foothill yellow-legged frog (*Rana boylii*, RABO); and northwestern pond turtle (*Emys marmorata marmorata*, EMMA). None of these species are currently listed under the federal or state endangered species acts, but all are listed as California Species of Special Concern.

The initial WA for the Upper Eel River WAU, completed in 2007, included an Amphibian and Reptile Module (Appendix F) (Scotia Pacific 2007) which described the life history and habitat requirements of the covered species. Further discussion, including monitoring methods, have been provided in HRC Amphibian and Reptile HCP Annual Reports.

RESULTS AND DISCUSSION

For tailed frogs, site occupancy and habitat conditions (Table 1 and 2) were monitored at ten different sites during 2013 and 2021. Effort was not equal over the years. A total of 42 individual belt surveys were conducted (Table 2).

For southern torrent salamanders, site occupancy and habitat conditions were monitored at 18 different sites during the years 2012-2014, and 2021. A total of 110 surveys were conducted during the period (Table 3).

For foothill yellow-legged frogs, site occupancy and habitat conditions have been monitored at 45 sites over the years 2011 - 2013, 2017, and 2021. A total of 157 individual surveys were conducted during this time (Table 4).

Surveys for northwestern pond turtles have indicated that they are common in suitable habitat on the mainstem Eel River (i.e., deep pools with suitable basking structure). We have also monitored small ponds located within tributary drainages such as Carson Creek, Balcom Creek and Pond Creek. We visited three monitoring locations to check for occupancy in 2021 (Table 5).

Tailed Frog

In the initial Upper Eel WA, tailed frogs were detected in the steep Channel Geomorphic Unit (CGU) tributaries of the Eel River and Larabee Creek. Tailed frogs were also found in lower gradient CGUs along Larabee Creek, however, within this CGU the animals were located within high gradient riffles within the reach.

As a result of the surveys from the original WA, we established ten monitoring locations. Complete survey results for tailed frog are shown in **Error! Reference source not found..**

These sites have been visited a total of 16 times, with 42 belt surveys, since the initial Upper Eel WA. Tailed frog adults and tadpoles were observed on 14 of the surveys. Southern torrent salamanders, coastal giant salamanders (*Dicamptodon tenebrosus*), red-legged frogs and foothill yellow-legged frogs were also observed.

Sample sizes are relatively small, but some patterns emerge from analysis. Belt habitat type was primarily low gradient riffle (LGR) and high gradient riffle (HGR) at 57% and 29%, respectively (Figure). Observing tailed frogs, in particular tadpoles, in riffles is consistent with the tailed frog literature (e.g., Nussbaum et al. 1983).

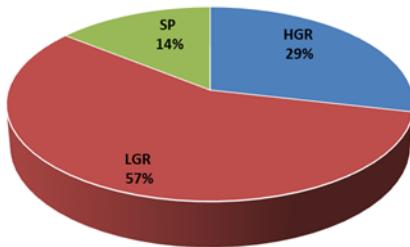

Figure 1. Belt habitat types at Upper Eel WAU tailed frog monitoring sites, 2013-2021.

Belt gradient ranged from 2 to 80%, with a mean of 13.2%. For belt substrate, all sites were of competent rock. This result is consistent with all monitoring sites being located within consolidated geologies. Belt embeddedness calls ranged from 1-3 with a mean of 2.3 (0 to 50% embeddedness, mean in the 26-50% range). When compared to the Properly Functioning Conditions (PFC) Matrix used for habitat condition evaluation in the initial WA, code 2 embeddedness would fall within the Poor (i.e., > 40%) category.

Belt canopy cover had a range of 59% to 100%, with a mean of 88%. The PFC target for canopy cover considered beneficial for tailed frog is > 85%. Tailed frog observations in 2021 were of tailed frog tadpoles, indicating that successful breeding is occurring in this WAU.

Southern Torrent Salamander

In the initial watershed analysis for the Upper Eel WAU, southern torrent salamanders were observed in Class II streams only, and were associated with streams in the Yager formation, but not in the Wildcat formations. We have continued to monitor the sites investigated during the initial WA and have added additional sites over time. Additional sites were among the areas identified for surveys or as potential habitat during the initial WA. Complete survey results southern torrent salamander are shown in

Figure 4. Example of occupied southern torrent salamander habitat.

There are currently 18 southern torrent salamander monitoring sites in the WAU. There has been a total of 27 visits to the monitoring sites during the years 2013-2021. Surveys consisted of 44 individual belt surveys. Southern torrent salamanders were observed at 15 of the 18 monitoring sites during the survey period. Other species observed at these sites include tailed frog, coastal giant salamander, northern red-legged frog, and foothill yellow-legged frog.

Figure 2. Larval southern torrent salamander.

Overall, belt gradient ranged from 2% to 98%, with a mean of 35%. The substrate at all belts consisted of competent rock. High gradient riffle (HGR) and Cascade falls (CF) were the primary habitat types (46% and 39% respectively). Results are consistent with the literature regarding the habitat of the southern torrent salamander (e.g., Diller and Wallace 1996).

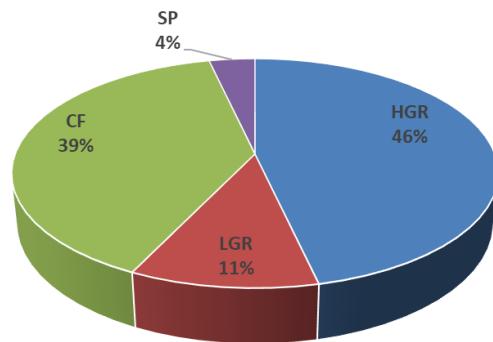

Figure 3. Belt habitat types at Upper Eel WAU RHVA monitoring sites, 2013-2021.

Figure 4. Example of occupied southern torrent salamander habitat.

Belt embeddedness ranged from 1 to 3 calls (0 to 75% embeddedness), with an average of 1.9. When compared to the PFC Matrix used for habitat condition evaluation in the initial WA, this result would generally fall within the Good (i.e., < 25%) to Fair (i.e., 25-40%) targets.

Belt canopy cover had a range of 23% to 100%, with a mean of 83%, close to the PFC target for canopy cover considered beneficial for southern torrent salamanders at > 85%. Both larvae and adult southern torrent salamanders have been observed in the WAU in 2021, indicating that the species is continuing to inhabit and breed in the WAU.

Foothill Yellow-legged Frog

The foothill yellow-legged frog is widely distributed along the Upper Eel River and its floodplain tributaries, including Larabee Creek, and was noted in the initial WA as being the most frequently observed species. For monitoring purposes, we have continued to focus on the mainstem Eel River and Larabee Creek, as well as several of the tributaries that had been identified as potential habitat in the initial WA. Surveys were conducted during 2011 - 2013, 2017 and 2021. A total of 157 surveys were conducted at 45 sites during this time. Foothill yellow-legged frogs were observed at 43 of the 45 monitoring sites (Table 4). Coastal giant salamanders, northern red-legged frogs, rough-skinned newts, tailed frogs, and Pacific tree frogs were also observed.

Habitat and substrate conditions on these surveys are consistent with known foothill yellow-legged frog habitats and the existing literature on the species. Stream segment habitats consisted primarily of low and high gradient riffles (33% and 22% respectively) (Figure 5). Boulder and cobble comprised 74% of the substrate types encountered (45% and 29% respectively), while gravel made up 23%. The range of canopy cover estimates at the stream segments reflects the distribution of sites ranging from the Eel River and Larabee Creek floodplains up into the floodplain tributaries, as 22% of the sites were in the low canopy category (0-20%), and 72% falling within 61-80% and 81-100% (26% and 46% respectively).

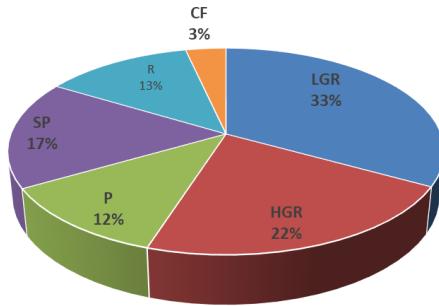

Figure 5. Stream segment habitat types at Upper Eel WAU foothill yellow-legged frog monitoring sites, 2011-2021.

Northwestern Pond Turtle

For the initial Upper Eel WA, pond turtles were observed in the main stem of the Eel River, main stem of Larabee Creek (below the gorge), and at the Balcom Creek and Scott Creek ponds. These observations were primarily of turtles basking on large wood or rocks on the ponds or large pool areas of the low gradient watercourse reaches, and in some cases of turtles seeking refuge on underwater habitat structure.

Using our knowledge of locations of suitable habitat within the WAU we have subsequently surveyed and documented at least three northwestern pond turtle sites on HRC lands. These include the Mainstem Eel, Balcom Creek, and Pond Creek sites. Habitat is characterized by deep pools, abundant LWD and boulders for basking, and adjacent sandy banks that can be used for nesting.

Surveys were conducted during the summer of 2021 (Table 5). Drought conditions during 2021 and preceding years have resulted in the smaller ponds being dry or nearly so (i.e., Balcom Creek and Pond Creek). Scott Creek Pond has been dry and was not surveyed. In contrast, large pools on the mainstem Eel River continue to show occupancy of northwestern pond turtles in spite of low flow conditions. In fact, during low flow conditions turtles are often more visible due to greater availability of basking sites.

Relative to pond turtle habitat conditions, pool frequency, pool quality, LWD, and canopy cover do not appear to be limiting factors on the Upper Eel River and Larabee Creek. Northwestern pond turtles seem to be locally abundant in the monitoring reaches, as well as in similar habitat elsewhere on the river.

Figure 6. Northwestern pond turtles basking on logs on Eel River.

SUMMARY AND RECOMMENDATIONS

For the 2021-2022 survey period efforts were focused on occupancy level surveys in the Upper Eel WAU to support the watershed analysis revisit, site-specific watershed analysis questions, and on classification of waters for THPs.

Distribution of covered species continues to be widespread in suitable habitat. No degraded habitats of any of the species were noted. Watershed analysis has aided in finding areas of good habitat to be maintained, as well as areas of habitat that can be improved or restored. No changes in the monitoring strategy are recommended at this time.

A = adult, L = larvae, T = tadpole, J = juvenile, NA = not available

LGR = low gradient riffle, C/F = cascade/falls, HGR = high gradient riffle, SP = step pool

ASTR = *Ascaphus truei* (tailed frog), DITE = *Dicamptodon tenebrosus* (coastal giant salamander),

RHVA = *Rhyacotriton variegatus* (southern torrent salamander)

Table 4. Complete results of foothill yellow-legged frog (RABO) surveys.
